Microsoft 365 & Entra ID
Identity Access Investigation

Portfolio case study | 20 October 2026 | Training tenant | Simulated incident

Executive summary

A fictional employee reported unavailable Outlook, Teams and SharePoint access. Actual authorized, read-only checks were conducted in a personal Entra practice tenant. The investigation confirmed an enabled account, a direct Global Administrator role, a successful Azure Portal sign-in, and no assigned Microsoft 365 product licenses. No real application failure or service restoration was demonstrated.

Technical investigation

Stage	Observed result
Identity	Account enabled; user type Member
Privilege	Direct Global Administrator assignment
Authentication	Azure Portal interactive sign-in succeeded; error code 0
Entitlement	No license assignments found
Workstation	PowerShell 7.5.4; Microsoft.Graph 2.41.2 installed
Graph SDK	Delegated User.Read connection displayed success
Context anomaly	Get-MgContext selected properties empty; dependent Get-MgUser failed
Graph REST	GET /v1.0/me successfully returned user profile

Analysis and boundaries

A successful Azure Portal sign-in does not establish access to Outlook, Teams or SharePoint. Missing licensing may explain lack of entitlement for licensed services, but the simulated incident root cause remains undetermined. The Graph /me success demonstrates one authenticated API request despite an unresolved SDK context anomaly. No user, role, license, Conditional Access or session setting was changed.

Enterprise controls

The portfolio includes a P1-P4 example severity matrix, escalation RACI, decision tree, approval and rollback template, least-privilege guidance, privacy-redacted evidence, Pester unit tests and offline GitHub Actions checks. These supporting artifacts are proposals or offline engineering work, not claims of production remediation.

Outcome

Training investigation documented; simulated incident NOT resolved. A real resolution would require the affected workload error, approved remediation, successful end-user retest and closure confirmation.

Evidence and limitations

Ten edited screenshots are indexed in docs/EVIDENCE_INDEX.md. Sensitive identifiers and browser tabs are removed. Heavy masking intentionally limits the visible evidence in some screenshots. See README.md, docs/VALIDATION_AND_LIMITATIONS.md and docs/TESTING_AND_ACCEPTANCE.md for detailed methodology and test boundaries.
